## RESEARCH PROJECTS

|                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |                              |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------|
| <b>Master's Thesis: Discount Optimisation in DTC Email Marketing (8/10)</b><br><i>Under Armour Europe BV × Rotterdam School of Management</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                        | <i>Mar. 2025 – Jun. 2025</i> |
| ◦ Built an end-to-end personalized discount optimization pipeline: K-means customer segmentation, propensity score estimation (logistic regression), IPW-adjusted causal forest (EconML), and off-policy evaluation (OPE).<br>◦ Estimated heterogeneous treatment effects (CATE) across 4 customer segments; dual-threshold policy (purchase probability $\geq 0.70$ , uplift $\geq 0.01$ ) achieved +1.22 margin uplift per customer and 82.2% discount cost reduction vs. historical policy.<br>◦ Validated robustness via 500-sample bootstrap (95% CI [0.0058, 0.0070]) and recall test (0.98) on held-out data. |                              |
| <b>Bachelor's Thesis: Evaluating GenAI Text Quality in Professional Writing (95/100)</b><br><i>Peking University</i>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | <i>Nov. 2023 – Mar. 2024</i> |
| ◦ Corpus analysis of 620 <i>People's Daily</i> obituaries (2016–2023); Python (Jieba, TF-IDF) + move analysis (Swales 1990) to extract standardized rhetorical structure across three subject categories.<br>◦ Trained Kimi Chat (LLM) on annotated corpus; AI-generated obituaries achieved cosine similarity of 0.91 with held-out military-official originals.                                                                                                                                                                                                                                                    |                              |

## PROFESSIONAL EXPERIENCE

|                                                                                                                                                                                                                                                                                                                                                                                                                                 |                                                               |
|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------|
| <b>Commercial Intelligence Pipeline — Reederei Nord BV</b><br><a href="https://github.com/yoojinshim/reedereiProject">github.com/yoojinshim/reedereiProject</a> 🔗                                                                                                                                                                                                                                                               | <i>Apr. 2026</i>                                              |
| ◦ Audited 9 datasets (711 voyages, 2022–2024) for a crude tanker operator; delivered three quantified commercial findings to the MD including a \$3.5M TCE gap and \$351K–\$737K in understated demurrage revenue.<br>◦ Built a reproducible Python/SQL ETL pipeline (DuckDB Star Schema), Streamlit dashboard, and an LLM extraction pipeline (Claude Sonnet) on 711 broker recap emails, reducing null rate from 21% to 5.4%. |                                                               |
| <b>Pricing Analyst Intern</b><br><i>Under Armour Europe BV</i>                                                                                                                                                                                                                                                                                                                                                                  | <b>Amsterdam, Netherlands</b><br><i>Feb. 2025 – Jun. 2025</i> |
| ◦ Built ML-assisted discount optimization models and GMV incentive frameworks; data pipelines in SQL, modeling in Python.<br>◦ Delivered pricing recommendations adopted in seasonal campaign planning across EU markets.                                                                                                                                                                                                       |                                                               |
| <b>E-commerce Analyst Intern</b><br><i>Kuaishou Technology — Food &amp; Health Team</i>                                                                                                                                                                                                                                                                                                                                         | <b>Beijing, China</b><br><i>Aug. 2023 – Nov. 2023</i>         |
| ◦ Designed a tiered GMV incentive framework ( $0.8\times/1.0\times/1.2\times$ multipliers on a rolling 90-day baseline) for key merchant accounts; analyzed multi-channel performance (GMV, engagement) via SQL to calibrate targets.<br>◦ Optimized ETL pipelines and BI dashboards to enable real-time in-campaign decision-making, reducing time-to-insight within active campaign cycles.                                   |                                                               |

## SKILLS

**Languages:** English (fluent), Cantonese (basic), Mandarin (native), Korean (native).  
**Programming:** Python, SQL, HTML/CSS.
